BM25 keyword search

การค้นแบบ BM25

ค้นคำตรงตัวเพื่อเสริมการค้นด้วยความหมาย

BM25 ranks documents using keyword occurrences and document length. It can help with exact terms and abbreviations. A hybrid search system merges the keyword ranking with a dense semantic ranking, for example using reciprocal rank fusion. Thai keyword search benefits from word tokenization rather than splitting only at spaces.

Cross-encoder reranking

การจัดอันดับใหม่

ให้โมเดลพิจารณาคำถามคู่กับข้อความทีค้นได้

A cross-encoder reranker reads a query together with each candidate document and predicts a relevance score. It is applied after first-stage retrieval. Reranking can reorder retrieved candidates, but it cannot recover a relevant document that was never retrieved. This demonstration compares the order before and after reranking.
